Summary

Cloud Support Engineer with 9 months of hands-on experience at Engiplex Solutions, building and automating production-grade AWS infrastructure across dev, staging, and production environments. Reduced provisioning time by 40% using Terraform IaC, architected a fault-tolerant 3-tier infrastructure with ALB, ASG, and Multi-AZ RDS, and built serverless cost optimization pipelines reducing unnecessary AWS spend.

Technical Skills

Cloud (AWS): EC2, VPC, S3, IAM, EBS, RDS, Route 53, ALB, ELB, ASG, Multi-AZ, SNS, SQS, Lambda, API Gateway, ECR, ECS, CloudTrail
Infrastructure as Code: Terraform (Modules, Variables, Outputs, Remote S3 Backend, DynamoDB State Locking)
CI/CD: Jenkins, GitHub Actions (Workflows, Triggers, Secrets, Environment Variables, Sequential Jobs, Conditional Execution, Artifacts, Reusable Workflows, Docker Integration, Terraform Automation)
Containerization: Docker (Dockerfile, Multi-stage Builds, Docker Compose, Networking, Volumes, Image Optimization, Layer Caching, Container Lifecycle Management, GitHub Actions CI/CD Integration)
AWS Security: GuardDuty, Inspector, AWS Config, AWS Detective, AWS Macie, WAF, Shield, KMS, Secrets Manager
Languages & SDKs: Bash Shell Scripting, Python (Boto3)
Networking: VPC Design, VPC Peering, Transit Gateway, Public/Private Subnets, Route Tables, IGW, NAT Gateway, Security Groups, NACLs, DNS Resolution, HTTP/HTTPS, TLS/SSL, TCP/IP, Subnetting, OSI Model, Load Balancing, CDN (CloudFront)
Monitoring: CloudWatch (Dashboards, Alarms, Logs Insights, Custom Metrics)
Linux: Linux Administration, File Permissions, User & Process Management, Package Management, Log Management, System Monitoring, Cron Jobs, SSH, Service Management
Version Control: Git, GitHub
Methodologies: SDLC, Agile
Tools: Jira, Nginx, Apache

Professional Experience

Cloud Support Engineer Oct 2025 – June 2026
Engiplex Solutions *Bangalore, Karnataka*

- Deployed and managed AWS infrastructure (EC2, S3, RDS, IAM, Route 53) across 3+ environments supporting cloud-based applications in development, staging, and production.
- Designed high-availability architecture using ALB and ASG across 2 Availability Zones, eliminating single points of failure and improving fault tolerance.
- Automated infrastructure provisioning with Terraform using reusable modules, cutting manual setup time by approximately 40%.
- Containerized and deployed 2+ applications using Docker, eliminating environment mismatch issues between development and production.
- Developed GitHub Actions CI/CD pipelines to automate Docker image builds, Terraform validation, infrastructure deployments, and application delivery, reducing manual deployment effort and improving release consistency.
- Built CloudWatch dashboards with custom alarms across 5+ metrics, enabling proactive issue detection and reducing average incident response time.

Projects

Production-Grade 3-Tier Architecture on AWS | *EC2, VPC, ALB, ASG, RDS, CloudWatch, IAM* | Link

- Architected a production-grade 3-tier AWS infrastructure across 2 Availability Zones with isolated public and private subnets for web, application, and database tiers.
- Configured ALB with path-based routing and ASG with dynamic scaling — enabling automatic scale-out from 2 to 4 EC2 instances with least-privilege IAM roles and Security Groups per tier.
- Deployed RDS MySQL in private subnets with Multi-AZ failover ensuring zero single point of failure; CloudWatch alarms with SNS alerts enabling sub-5-minute issue detection.
- Deployed a full-stack web application across all three tiers, validating end-to-end connectivity in a production-grade environment.

AWS Infrastructure Automation using Terraform | *Terraform, VPC, EC2, IAM, S3, DynamoDB, GitHub Actions* | Link

- Automated provisioning of 10+ AWS resources including VPC, EC2, IAM roles, and Security Groups using Terraform, reducing manual setup time by approximately 60%.
- Built 4+ reusable Terraform modules with variables and outputs, enabling consistent one-command infrastructure deployment across dev and prod environments.
- Configured S3 remote backend with DynamoDB state locking, preventing concurrent state conflicts across team deployments.
- Integrated a GitHub Actions CI/CD pipeline to automate Terraform format checks, validation, and plan generation, with automated apply on push to main.

AWS Cost Optimization Toolkit | *Lambda, EventBridge, SNS, IAM, Python (Boto3)* | Link

- Built serverless automation using Python (Boto3) to detect stale AWS resources — unattached EBS volumes, unused Elastic IPs, and oversized S3 buckets — via Lambda triggered by EventBridge schedules.
- Automated EC2 instance shutdown and startup using Lambda and EventBridge cron expressions, reducing compute costs during non-business hours.
- Configured SNS notifications for real-time cost alerts, enabling proactive resource cleanup and reducing unnecessary AWS spend.

EDUCATION

SGGS Institute of Engineering and Technology — Nanded, Maharashtra
B.Tech in Information Technology | CGPA: 7.8/10 — *2021 – 2025*
